Modified Early Obstetric Warning Score (MEOWS) in Detecting the Seriously Ill and Deteriorating Woman Clinical Guideline

V3.0

April 2021
1. Aim/Purpose of this Guideline

1.1. The MEOWS observation chart facilitates a standardised approach to recording vital signs to record routine clinical data and track a patient’s clinical condition to alert the clinical team to any untoward clinical deterioration and to monitor clinical recovery. The MEOWS should determine the urgency and scale of the clinical response. This guideline is to provide guidance for staff within the maternity services on recognising and monitoring the obstetric patient using MEOWS. This will enable early recognition of deterioration, advice on the level of monitoring required, facilitate better communication with the multi-disciplinary team and ensure prompt management of any woman who is deteriorating.

This guideline to be read in consideration with the following guidelines
- VTE risk assessment in pregnancy, labour and post-partum period
- Eclampsia and severe pre-eclampsia
- Vaginal birth after caesarean section (VBAC)
- Epidurals analgesia in Labour
- Caesarean Section
- Obstetric Haemorrhage
- Maternal collapse in pregnancy and puerperium
- Severely ill obstetric woman-the management and early recognition of
- Sepsis with BUFFALO

1.2. This version supersedes any previous versions of this document.

Data Protection Act 2018 (General Data Protection Regulation – GDPR) Legislation

The Trust has a duty under the DPA18 to ensure that there is a valid legal basis to process personal and sensitive data. The legal basis for processing must be identified and documented before the processing begins. In many cases we may need consent; this must be explicit, informed and documented. We cannot rely on opt out, it must be opt in.

DPA18 is applicable to all staff; this includes those working as contractors and providers of services.

For more information about your obligations under the DPA18 please see the Information Use Framework Policy or contact the Information Governance Team rch-tr.infogov@nhs.net

1.3. This guideline makes recommendations for women and people who are pregnant. For simplicity of language the guideline uses the term women throughout, but this should be taken to also include people who do not identify as women but who are pregnant, in labour and in the postnatal period. When discussing with a person who does not identify as a woman please ask them their preferred pronouns and then ensure this is clearly documented in their notes to inform all health care professionals (NEW 2020).
The Guidance

2.1 Early recognition of critical illness, prompt involvement of senior clinical staff and multidisciplinary team working remain key factors in providing high quality care (MBRRACE, 2016).

2.1.1 The early detection of critical illness in pregnant women remains a challenge to all professionals involved in their care. The relative rarity of such events combined with the normal physiological changes associated with pregnancy and childbirth compound the complexity of early detection.

2.1.2 It is recognised that pregnancy and labour are normal physiological events. However, recording of physiological observations is an integral part of maternity care. Regular recording and scoring of these observations will aid the recognition of any changes in a woman’s condition. Using MEOWS will prompt early referral to the appropriate practitioner who can undertake a full review, order appropriate investigations resuscitate and treat as required.

2.1.3 MEOWS is a way of formalising measurement of physical variables which are translated into a score which has a critical threshold, above which medical review and intervention is required (see appendix).

2.1.4 The small changes in the combined physiological variables measured by MEOWS may pick up deterioration earlier than an obvious change in an individual variable. Early detection will trigger prompt intervention that will either reverse further physiological decline or facilitate timely referral to an appropriate person.

2.1.5 There is a potential for any woman to be at risk of physiological deterioration and this cannot always be predicted. The use of MEOWS does not demand critical care or define treatment in maternity care but is a tool to aid early recognition and management of deteriorating woman, thus all women must have AN MEOWS score charted on admission or initial assessment in both hospital and community setting (oxygen saturations are not required in the community setting). It must be acknowledged that no tool can replace the actual physical examination of a woman and clinical assessment of her condition. Often there are clinical signs that precede collapse.

2.1.6 The use of an early warning score is supported by NICE guidance (2007).

2.2 Use of MEOWS chart

2.2.1 MEOWS is calculated by scoring the values of a full set of observations carried out routinely for all women by staff which include:
- Temperature
- Systolic blood pressure
- Diastolic blood pressure
- Heart rate
- Respiratory rate
- Oxygen saturation. Remember the score is uplifted by 2 points for women requiring supplemental oxygen to maintain recommended oxygen saturation
- Level of consciousness using AVPU (see appendix). Pain score
- PV bleeding

A total of 5 or more or 3 in one parameter will trigger an increased frequency to a minimum of hourly observations and midwife to urgently escalate care to the obstetric team (please see MEOWS chart appendix). A new score of 5 or more is a key threshold and is indicative of potential deterioration. All women with a MEOWS score of 5 with known infection, or high risk of infection or suspected infection ‘think sepsis’ and undertake the sepsis assessment tool.

2.2.2 Escalation and clinical response timings
The woman should receive an urgent Obstetric or anaesthetic review within the timescale set on the MEOWS chart. First escalation of care is appropriate to SHO level. If the SHO is unable to attend escalate to the Specialty Registrar level (SpR). If the SpR is unable to attend within original the time scale escalate to the anaesthetic SpR or Consultant obstetrician.

If ≥ 5 or 3 in any one parameter (Amber) Midwife to urgently inform the obstetric team caring for the patient using the SBARD tool. Urgent assessment by obstetrician or anaesthetist to take place within 45 minutes of the observations

- If ≥ 7 (Red) Midwife to immediately inform the obstetric team caring for the patient using the SBARD tool- this should be least at specialist registrar level and take place within 30 minutes of the observations. Consider via 2222
- Ensure clinical care is in an environment with monitoring facilities
- Emergency assessment by the Obstetric or Anaesthetic team
- Inform Outreach/CCU if senior review not occurred within 30 minutes of the observations or patient deteriorating

2.3 Respiratory rate & MEOWS
- Changes in the respiratory rate are often an early warning sign that the woman’s condition is deteriorating
- It is vital to also note the regularity, pattern and description of the breathing
- A change in the respiratory rate is an accurate predictor of deterioration in physical condition, often before changes in any other parameters are observed

2.4 Oxygen saturation & MEOWS
Sat O2 monitoring should be undertaken for all women except in the
2.5 Temperature & MEOWS
During labour a slight transient raise in temperature is often observed and this may also be seen as a response to epidural anaesthesia. The patient’s temperature should be considered in the context of other potential risk factors however a rise in temperature observed at any other time in the pregnancy continuum must be closely observed. A marked rise in temperature or a marked fall could indicate an impending risk of infection or sepsis. The early recognition and appropriate treatment for sepsis is essential.

2.6 Heart rate & MEOWS
Most women have an increased heart rate (of about 20 bpm) in pregnancy compared to the non-pregnant state due to the associated physiological changes. The pulse will also increase during periods of strenuous activity and/or stress. A sudden rise in heart rate may be in response to labour, pain, fear, anxiety, etc. and in isolation (all other parameters are normal) should be observed. A prolonged tachycardia, in conjunction with any other abnormal observation, must be treated as potentially very serious.

A slow pulse may result from effective pain relief such as an epidural, especially when the woman is relaxed and possibly able to sleep. However, slower heart rates can also be:
- drug induced e.g. such as epidural fluids leaking directly into the bloodstream
- present in cardiac complications
- in conjunction with a raised blood pressure and sudden loss of consciousness could indicate cerebral haemorrhage

2.7 Blood pressure & MEOWS

2.7.1 During pregnancy there are natural variations in BP due to the associated physiological changes: e.g. diastolic may fall around 20mmHg from non-pregnant state in the first trimester. Underlying hypertensive problems/renal disease with these conditions women may not exhibit a first trimester drop in blood pressure and may go on to have hypertensive problems in this or later pregnancies.

2.7.2 Pre-eclampsia
- Some women developing pre-eclampsia may be normotensive
- In the presence of proteinuria and altered blood profiles women should be closely monitored.

2.7.3 Identifying significant changes in BP
The systolic pressure is sensitive to activity, stress and anxiety and transient rises up to 150 are considered normal.
- A lower systolic reading is common in pregnancy
- A sudden decrease in blood pressure especially with a corresponding increase in pulse rate may indicate haemorrhage

2.8 Pain scores & MEOWS
Pain scores should be assessed between contractions (if in labour) or when the woman is resting. Any pain outside that expected of normal labour is abnormal, and this should be regularly reviewed and documented, including site, type of pain (constant, intermittent, on movement only, sharp, dull, etc) as well as the intensity. Following surgical intervention pain is a normal physiological response to trauma but pain assessment is essential to ensure adequate analgesia is prescribed and administered.

### 2.9 Conscious level and MEOWS
It is essential to recognize the importance of new-onset confusion, disorientation, delirium as a sign of potentially serious clinical deterioration (New 2018)

### 2.10 Observation parameters

2.10.1 The frequency of observations is described on the MEOWS chart and is dependent on the MEOWS score.

2.10.2 Maternity support workers are essential and valued members of the maternity workforce and have the skills to undertake most aspects of MEOWS observations. These can be recorded with the exception of pain score and PV bleeding and it is the responsibility of the Maternity Support Worker carrying out the observations to alert the midwife/nurse responsible for the patient so that the MEOWS score can be completed. A MSW cannot complete a full MEOWS score on any patient.

### 2.11 The process for use of MEOWS
All women admitted must have a MEOWS score calculated and frequency of monitoring and clinical response appropriate to score as per MEOWS chart.

### 2.12 Delivery Suite

2.12.1. MEOWS every 4 hours (unless clinically indicated to do more frequently). Perform a full set of observations and calculate and document a MEOWS score on the partogram. If the score indicates escalation to the obstetric team use the SBARD hand over tool (NEW 2020).

2.12.2. Any observations considered abnormal for the clinical situation must trigger a full MEOWS assessment and score to determine the frequency of monitoring and escalation of care.

### 2.13 Antenatal Ward
Frequency of observations will depend on the nature of the admission or as indicated the MEOWS score. As a minimum a full set of observations must be carried out and charted on the MEOWS chart every 12 hours (NEW
2.14 Postnatal Care

2.14.1 All women must have a full set of observations prior to transfer to the postnatal ward or discharge home from delivery suite MEOWS score calculated. The nature of further observations and escalation of care will depend on the MEOWS score.

2.14.2 All women who score MEOWS of 5 or above or have had sepsis screening, please refer the baby to the neonatologist.

2.15 Community

2.15.1 All women must have a baseline set of observations charted on a MEOWS chart in the community setting. Further observations and escalation of care will depend on MEOWS score (without sa02).

2.15.2 The MEOWS scoring should be used in the pre-hospital assessment of acutely ill women by ‘first responders’ e.g. community midwives and ambulance services to triage and communicate acute-illness severity to the receiving hospital. If the score is >7 continuous monitoring is indicated and cannot be achieved until SWAST arrives. Therefore, the community midwife will undertake MEOWS observations every 15 minutes until able to achieve continuous monitoring.

2.15.3 In the event that a woman deteriorates and becomes seriously ill, it may be appropriate to involve medical staff from other disciplines such as critical care, haematology and renal medicine. This will be a consultant to consultant referral.

2.16 Roles and responsibilities

2.16.1 Maternity Support Worker (MSW)
To obtain vital signs observations and record them on the MEOWS chart reporting to a named midwife any abnormalities detected (any observations that score 1 or above).

2.16.2 Midwife

2.16.2.1 To assess additional parameters of MEOWS and calculate the total score or undertake full MEOWS observations and score.

2.16.2.2 To escalate within the required timeframes following the MEOWS triggers table.

2.16.2.3 To ensure the escalation is followed appropriately and escalate further (to Outreach/ICU teams) if unable to obtain senior review and/or clear care plan within the 30 min timescale or if woman is deteriorating rapidly.
2.16.3 **Obstetric team**

2.16.3.1 To respond to the escalation as per MEOWS triggers table.

2.16.3.2 Doctors called to review patients with a MEOWS trigger should ensure that there is a clear patient review and time limited management plan in the medical notes and discussed with the midwife caring for the patient.

2.16.3.3 If the physiological parameters are accepted by the medical staff as appropriate/normal/acceptable for that individual patient then this should be clearly indicated in the midwifery and medical notes.

2.16.3.4 If women deteriorate and become severely ill to coordinate involvement from the multidisciplinary team if required (Anesthetic Team, Outreach etc.)

2.16.3.5 Regular Consultant involvement is needed in care of women who deteriorate and become severely ill.

2.16.4 **Anesthetic team**

2.16.4.1 All severely ill women should be reviewed by multidisciplinary team involving the Anesthetists.

2.16.4.2 For the Consultant Anesthetist to liaise with the ITU/HDU team if transfer is necessary.

2.16.4.3 To document care plans in maternal notes with the planned review times.
3. Monitoring compliance and effectiveness

1. **Policy Aim**  
Who is the strategy / policy / proposal / service function aimed at?  
To provide guidance for staff within the maternity services on recognising and monitoring the obstetric patient using MEOWS.

2. **Policy Objectives**  
Early recognition of deterioration, advice on the level of monitoring required, facilitate better communication with the multi-disciplinary team and ensure prompt management of any woman who is deteriorating.

3. **Policy Intended Outcomes**  
Safe, appropriate care of women in community and hospital environment.

4. **How will you measure the outcome?**  
Compliance monitoring tool.

5. **Who is intended to benefit from the policy?**  
All pregnant and newly delivered women.

6a). **Who did you consult with?**  
Workforce | Patients | Local groups | External organisations | Other |
<table>
<thead>
<tr>

</tbody>
</table>

If all characteristics are ticked ‘no’, and this is not a major working or service change, you can end the assessment here as long as you have a robust rationale in place.

I am confident that section 2 of this EIA does not need completing as there are no highlighted risks of negative impact occurring because of this policy.

Name of person confirming result of initial impact assessment: Sarah-Jane Pedler

If you have ticked ‘yes’ to any characteristic above OR this is a major working or service change, you will need to complete section 2 of the EIA form available here: Section 2. Full Equality Analysis

For guidance please refer to the Equality Impact Assessments Policy (available from the document library) or contact the Human Rights, Equality and Inclusion Lead india.bundock@nhs.net
